

DOC 9 • Builder Handoff

Project: Public Pulse / Poll Platform

Version: v1.1

Status: Builder Input Document (Regenerated)

Purpose

Transfer product intent into a builder workflow.

This document intentionally does NOT define:

architecture

stack

database

routing

deployment

component structure

implementation sequence

Builder decides those.

This document explains how to consume the project.

1. Builder Mission

You are receiving:

research

product intent

recommendations

preferences

constraints

examples

reference systems

You are NOT receiving:

final truth

locked implementation

fixed architecture

strict specifications

Your objective:

build the strongest version of the product.

Preserve intent.

Improve execution.

2. Input Package

Builder should consume:

DOC 0 Master PRD

↓

DOC 7 MVP Scope

↓

DOC 1 Categories

↓

DOC 2 Question System

↓

DOC 3 Question Standards

↓

DOC 4 Visualization System

↓

DOC 5 Result System

↓

DOC 6 Governance + Engagement

↓

DOC 8 Design Handoff (if available)

↓

Deep Research Output (later)

↓

Visualization References (later)

Read all.

Do not skip.

Treat later documents as refinement.

3. Interpretation Rules

Documents represent:

intent

recommendation

research

direction

preferences

not implementation.

Builder should preserve:

product philosophy

participation model

question-first experience

result reward model

Builder should challenge:

implementation

scope

structure

complexity

architecture

flows

only when justified.

4. Builder Operating Model

Builder workflow:

Understand

↓

Critique

↓

Propose

↓

Review

↓

Build

↓

Iterate

Builder should:

ask questions

request screenshots

request references

request examples

request clarification

request missing files

continue iteration.

Builder should not assume silence means approval.

5. Builder Authority

Builder owns:

architecture

technical decisions

stack

state

data structures

infra

performance

maintainability

quality

Builder does NOT own:

product philosophy

core positioning

experience goals

strategic direction

User owns direction.

Builder owns execution.

6. Challenge Rules

Builder should challenge ONLY when:

clear UX issue

clear implementation issue

clear contradiction

clear product risk

clear simplification opportunity

strong evidence exists

Builder should NOT challenge because:

taste

trend

fashion

personal framework preference

tool bias

novelty

Default:

preserve intent.

7. Builder Critique Expectations

Builder should actively detect:

missing systems

conflicts

scope leakage

overengineering

underengineering

feature duplication

contradictions across docs

bad assumptions

Builder should produce:

issues

alternatives

recommendation

tradeoffs

priority

complexity estimate

Questions first.

Build later.

8. Improvement Rules

Builder should propose:

simpler systems

smaller MVP

better UX

better interactions

better structure

cleaner implementation

Builder may add features ONLY when:

high confidence

low complexity

clear value

Explain additions.

Do not silently expand.

9. Scope Rules

Aggressively simplify.

Avoid:

scale theatre

premature infra

future-proofing

complex moderation

heavy analytics

growth systems

Optimize for:

learning

question testing

interaction testing

visualization testing

Questions:

Can this wait?

Can this be removed?

Can simpler work?

10. Design Relationship

If design exists:

builder follows design.

Builder may:

question

suggest

adapt

But should not silently rewrite.

If conflict exists:

builder proposes

design explains

user decides

Design owns:

screens

motion

flows

Builder owns:

implementation.

11. Deep Research Relationship

Deep research provides:

question inventory

metadata

recommendations

Builder should:

consume

review

challenge

not blindly import.

Builder may reject:

weak questions

duplicate questions

poor interactions

bad DVs

with reasoning.

12. Missing Systems

Expected missing areas:

trust engine

aggregation engine

analytics platform

recommendation engine

poll creation

monetization

community systems

Builder may leave hooks.

Do not fully build.

13. Expected Builder Outputs

Builder should eventually produce:

critique

gap analysis

implementation proposal

architecture

build roadmap

execution

iterations

screenshots

demo

questions

Not necessarily in order.

14. Builder Interaction Model

Builder should:

show progress

ask checkpoints

present alternatives

accept user direction

continue.

User reviews.

Builder executes.

15. Success Criteria

Success is NOT:

feature count

architecture beauty

screens

complexity

Success is:

people answer

people explore

people share

people return

product teaches.

Final Principle

Understand deeply.

Challenge carefully.

Improve intentionally.

Build decisively.
