Project: Public Pulse / Poll Platform Status: Working Master Version: v0.1 Role: Source of truth

1. Purpose

Build a product that lets people answer structured public questions and immediately discover what other people think.

This is not intended to become:

- traditional survey software
- polling software
- social media posting
- review platform
- discussion forum

Primary idea:

Question ↓ Answer ↓ Aggregation ↓ Visualization ↓ Reaction ↓ Return

The output experience is as important as answering.

2. Vision

Create the most satisfying way to explore public opinion.

The user should feel:

"I contributed."

+ "I learned something."

+ "I want to answer another."

Not:

"I filled a form."

3. Product Principles

P1 Participation beats perfection (MVP)

Questions should maximize:

- voluntary participation
- completion
- repeat behavior

while maintaining minimum legitimacy.

P2 Interesting outputs are mandatory

Results must feel:

- surprising
- comparative
- visual
- discussable
- shareable

Reject boring output.

P3 Experience > abstract opinion

Prefer:

- used
- visited
- watched
- experienced

Avoid:

- guessing
 - expertise-only
 - impossible comparison
-

P4 One question = one experience page

No artificial separation:

Question

+ Answer

+ Result

+ Extra exploration

exist together.

Visibility may change. Page remains unified.

P5 Visualization is product logic

Visualization is not decoration.

Question design should consider:

- result shape
 - visual potential
 - comparison quality
 - emotional payoff
-

P6 Mobile first

Assume:

- short attention
- thumb interactions
- low reading

Question: 1–2 lines preferred.

P7 Recommend, do not lock

All documents are recommendations.

Future agents must:

challenge critique improve replace

when evidence exists.

4. Product Hypothesis

Users return if:

Interesting Question ×

Fast Answer ×

Rewarding Result ×

Low Effort

is maximized.

Failure of any single factor reduces retention.

5. Product Scope

Current phase: Research

+ Planning

+ MVP definition

Not optimizing:

- monetization
 - architecture perfection
 - growth loops
 - moderation at scale
 - trust engine
-

6. Core User Journey

Entry ↓

Discover question

7. Product Layers

Layer 1 Categories

Layer 2 Question System

Layer 3 Question Standards

Layer 4 Visualization System

Layer 5 Result System

Layer 6 Governance

Layer 7 Engagement

Layer 8 MVP Scope

Layer 9 Builder Handoff

8. Builder Instructions

Builder should:

Understand every document.

For every decision:

1. Critique
2. Suggest alternatives
3. Find gaps
4. Recommend improvements
5. Estimate complexity
6. Prioritize

Builder owns:

- architecture
- implementation
- data structures
- technical tradeoffs

Builder does NOT own:

- product intent

9. Design Agent Instructions

Design agent should NOT inherit layouts.

Design agent receives:

features flows constraints preferences visual references

Design agent should determine:

- page structure
- spacing

- transitions
- component language
- motion
- consistency

Avoid premature locking.

10. Success Signals (MVP)

Primary: Questions answered

Secondary: Completion rate

Secondary: Return visits

Secondary: Share rate

Secondary: Result exploration

Not important initially: Revenue

11. Explicit Non Goals (Now)

Not building:

- open poll creation
 - social profiles
 - follow systems
 - trust engine
 - advanced weighting
 - experimentation platform
 - recommendation engine
 - analytics platform
-

12. Open Questions

To finalize later:

Product surface

Result reveal logic

Trust model

Poll lifecycle

Data weighting

Visualization rules

Growth systems

Final Principle

People should come for curiosity.

Stay for results.

Return for participation.
